# **Fuji Electric's Energy and Environment Businesses**

1923 Established Fuji Electric Manufacturing Co.,Ltd.

Fuji Electric

- 1962 Started operation of Chiba factory (transformer) 1968 Started operation of Kobe facrory (switchboard)
- 1971 Started manufacturing rectlfer transformer units
- 1974 Started manufacturing cast resin transformers
- 1984 Changed company name and logo to Fuji Electric Co.,Ltd.
- 1985 Delivered the first 800kV transformers
- 1990 Delivered the first 1,100MVA transformer
- 1996 Delivered the first 8,300kV Gas I nsulated Switchgear
- 2002 Introduced new company symbol mark
- 2009 Delivered the first 1,750V DC, 87.5kA power supply equipment

Fuji Electric is diligently pursuing synergy between its core power semiconductor and power electronics technologies, and is contributing to the realization of a responsible and sustainable society in the fields of industrial and social infrastructure through its four businesses in Power Electronics, Semiconductors, Power Generation, and Food and Beverage Distribution.

- 1988 Established as the Overseas Manufacturing Company of NihonDenki-Seiki Cop.[@ Nava NakornIndustrial Estate] (Sep)
- 1989 Started Mini-UPS production
- 2007 Started Medium-capacity UPS production
- 2010 Joined Fuji Electric Group (Company Name : Fuji Electric Power Supply(Thailand)Co., Ltd.) (Jan)
- 2012 Started Switching power supply, PCS and Low-voltage Inverterproduction
- 2013 Started Large-Voltage UPS production

- 2013 Started operation at the New Factory[@ChumnumsapIndustrial Estate] (Dec)
- 2014 Changed Company name: Fuji Electric Manufacturing (Thailand) Co., Ltd. (Jan)
- 2014 Started Vending Machine and GIS production
- 2016 Started SWGR production and Service business
- 2019 Started Engineering business
- 2020 Started operation at System production & Engineering Factory(3rdFactory) (Apr)
- 2022 LV SWGR(FSMBE) and CRT production

# From everyday buildings and factories to social and transportation. Active wherever electricity is used.

Fuji Electric became Japan's first manufacturer of cast resin transformers in 1974. Since then, we have sold over 100,000 units in 55 countries. We offer reliable and industry-proven transformers to meet the needs of our customers.

# infrastructures for energy

## **Applications**

Cast resin transformers are suitable for the following places.

- Sites where compact size and light weight are required.
- Sites where easy maintenance is required.
- Sites where there are airborne contaminants and extremely severe environments.
- Sites where fire prevention is the highest priority.

#### Applicable locations

Buildings	Hospitals
Hotels	Laboratories
Shopping centers	Schools
Art galleries	Theaters
Stadiums	Petrochemical plants
Industrial complexes	Underground railways
Railway substations	Cranes
Tunnels	Power supplies for construction sites
Water and sewerage plants	Wind power sites
Refuse disposal plants	

Multistory buildings

Railways

CCC.

# Fuji Electric's Cast resin transformers offer high and compactness, made possible by our unique

#### Vacuum-Casting

Cast resin transformer is manufactured with vacuum casting method using metal pattern. Therefore, they have the following features.

#### Void-less

Vacuum-casting method realizes highly reliable, voidless molded winding with excellent partial discharge characteristics.

#### **Fire prevention**

Molded insulated parts are fire resistant with selfextinguishing properties.

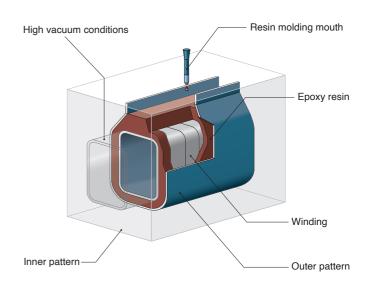

#### Resistance to humidity and dust

All winding conductors are molded. They have remarkable humidity resistance which prevents insulation materials from deteriorating due to dust and dirt during operation.

#### **Robust construction**

Molded winding is highly resistant to secondary shortcircuit fault and surface cracking.

#### Vacuum-casting method using metal pattern

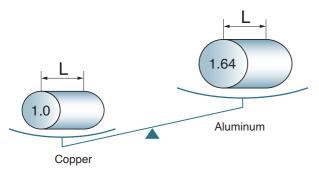

## Aluminum winding

#### (1) Weight reduction

The aluminum winding weights are approximately half of the copper winding, thus realizing weight reduction.

	Copper: Aluminum
Conductivity [%]	100:61
Cross sectional area ratio	001:1.64
Gravity [g/cm³]	8.9:2.7
Gravity ratio	3.3:1
Mass ratio	100:50

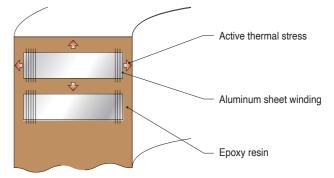

#### (2) Low thermal stress and excellent crack resistance

Aluminum's thermal expansion coefficient is close to resin, thus reducing thermal stress and improving crack resistance effectively.

Material	Thermal expansion coefficient	[mm/mm.h.°C]
Aluminum	2.3×10⁻⁵	
Copper	1.6×10-5	
Epoxy resin	3.3×10⁻⁵	

Thermal stress acting on winding

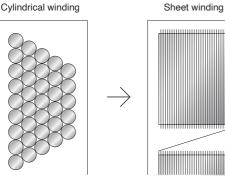

# functionality, high reliability, technologies and expertise.

## Sheet winding

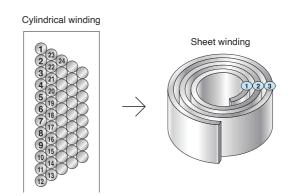

## (1) Downsizing

Sheet winding has high lamination factor, thus realizing downsizing of transformers.

## (2) High insulation reliability

In sheet winding, the voltage between turns is only for one turn, thus having high insulation reliability.

## **IEC** Certification

Fuji Electric's cast resin transformer have passed all tests of IEC60076-11 including special test and type test in 2006.

- Climatic class: C2 (crack resistance) Fire behavior class: F1 (fire resistance)
- Environment class: E2 (moisture resistance) 
  Short-circuit test

## Design Techniques / Test and Inspections

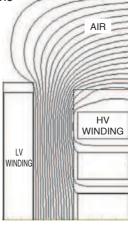

#### Vacuum-Casting

The insulation of a cast resin transformer is composed of resin-air composite insulation.

The distributed voltages of individual transformer parts depend on their respective dimensions.

Thus, appropriate dimensions for insulation are designed with electric field analysis of the individual parts of the winding including air space.

Example of electric field analysis

## Electric field analysis

#### Routine test control

- · Measurement of insulation resistance
- Measurement of voltage ratio and check of phase displacement
- Measurement of no-load loss and exciting current
- Measurement of short circuit impedance and load loss
- · Separated-source voltage withstand test
- · Induced overvoltage withstand test
- Measurement of insulation resistance
- Measurement of partial discharge

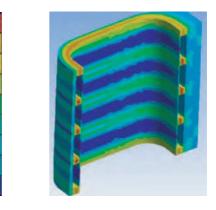

#### Type test

- · Lightning impulse voltage withstand test
- Temperature-rise test
- Measurement of sound level

#### Thermal stress analysis

Molded winding composed of conductor and insulating material is subjected to thermal stressed due to the difference in thermal expansion coefficient between conductor and resin, and thermal distribution in the winding block, where winding temperature varies with the load fluctuation of the transformer. The stress value obtained in thermal stress analysis is used to design optimum winding structure for high crack-resistance of winding.

Example of thermal stress analysis

## Accessories

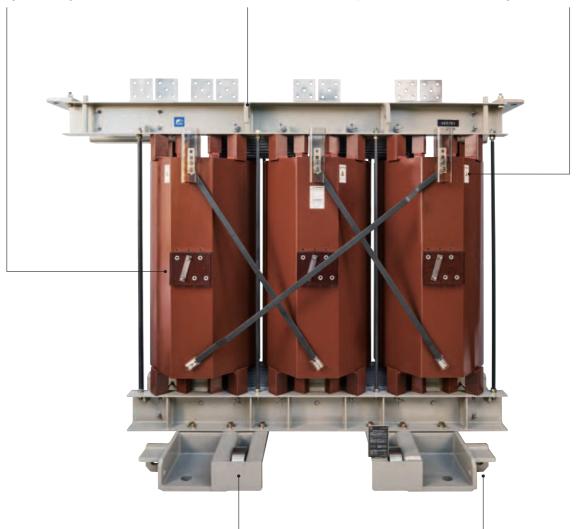

Off-circuit tap changer terminals The tap voltage can be changed by switching the shorting bar connector.

Lifting lugs Four lifting lugs are provided as standard fixtures on the transformer body.

Warning label A danger label is attached to warn against contacting the surface of the HV windings.

Rubber vibration isolator (Option) Bi-directional wheels (Option)

Dial thermometer (Option)

Earthing terminals with clamping bolts Two earthing terminals are provided at the lower frame ends : one on the primary side and one on the secondary side.(One of these earthing terminals is in use.)
