Fuji Electric Marine Exhaust Gas Cleaning System (EGCS)

Regarding the software update for Chelsea's Water Quality Meter (Sea Sentry) (Caution)

We hope this message finds you well and thriving.

We sincerely thank you for your continued patronage of our Marine Exhaust Gas Cleaning System (EGCS).
This is a cautionary notice for customers using Chelsea's water quality meter (Sea Sentry).

Due to changes in the sensor manufacturer's specifications,
the reference date for calculating the sensor's usage period
has been changed from the previous manufacturer's calibration date to the sensor's start date of use.
Therefore, it is necessary to update the water quality meter's software from Ver.L0.2 to L0.3.

Please download the software to a USB memory from the link below and use it.
Be aware that if you operate without updating, the turbidity sensor may break and become unusable.

For sensors that have been sent to us for calibration, we will ship them back with a USB
preloaded with the latest software version and an update procedure manual upon completion of the work.
Customers are requested to use the enclosed USB to perform the update.

We record the sensor serial number and the software version of the water quality meter
as part of our equipment delivery information management.
After completing the update, please take a photo of the information screen of the water quality meter,
and send it via email to x-kansai-ce@fujielectric.com

We kindly ask for your cooperation to provide you with comprehensive after-sales service.

Target turbidity sensor model: 2141-200-PL-*
